

ABSTRACT OF THE DISCLOSURE

This lamp assembly includes a reflector with first reflective concave surface region for directing light emanating from a first focal point adjacent to but spaced apart from the first reflective concave surface region into a near field beam and an adjacent second reflective concave surface region for directing light emanating from a second focal point adjacent to but spaced apart from the second reflective concave surface region into a far field beam. Preferably, the reflector is a unitary piece, and preferably has a substantially circular perimeter. The lamp assembly includes a high intensity discharge light source positioned substantially at the first focal point and a second halogen light source positioned substantially at the second focal point.
